Original versus replicated

All numbered figures and tables in the supplied final PDF

Replication is partial. Every numbered figure and table is included in this report, but the available data and code do not establish a complete numerical reproduction of the final paper.

The audit covers **8 figures and 15 tables**. Figures with continuations are retained as separate parts: 26 original/reproduction pairs in total. Each original screenshot is immediately followed by its independently rebuilt result. Documentary definitions and the acknowledgment image are identified as source reproductions.

What the comparison establishes

- Exact numerical agreement is possible for many results, including descriptive statistics, event scores, cutoff regression estimates, reasoning categories and the AR(1) table.
- Several numerical matches require a different sample or horizon than the printed description: the disagreement table uses different horizons across panels, and Table B.13 uses 2023-2024 and horizon 4 in its last column.
- The revision regressions remain unreproduced. The best-forecaster out-of-sample table and several reported significance tests also contain unresolved differences.
- Figures 2 and A.2 expose metadata-version differences. Figure 4 recovers the plotted histogram with 121 retained forecasters, although its caption states 194.

How to read this report

The next three pages provide the comparison table. The method page explains tolerances and provenance. Original screenshots retain the paper’s wording; the following reproduced pages carry audit notes. Matching a number does not establish that the paper’s stated method or interpretation is correct.

Reference: predictable_forecasters.pdf, 68 pages. Original PDF SHA-256: dfd6a8d67ab23a55023923ea1f2d77772136cb89fdfde721d71f57a68cd01086

Comparison table | 1 of 3

Numerical and documentary agreement are assessed separately; all discrepancies are retained.

Item / original page	Result	Evidence	Method or data limitation
F1 · p. 36 Example of forecaster acknowledgments	Source reproduced	Original acknowledgment image reused from manuscript asset.	Documentary image; not a newly calculated research result.
F2 · p. 37, 38 Characteristics of the SPF panel over time	Partial reproduction	Eight trait distributions recomputed for 100 quarters.	Available metadata differ from the final figure; stream smoothing also differs.
F3 · p. 39, 40 SPF and AI-generated median forecasts	Numerical match	All 16 plotted forecast series agree at PDF coordinate rounding.	Independent medians recomputed; typography and layout differ.
F4 · p. 41 Distribution of Forecaster Fixed Effects	Match with caveat	Histogram bars and visible means recovered from raw nowcasts.	Filtering before demeaning yields 121 forecasters; caption states 194. Generating code was absent.
F5 · p. 42, 43 Densities of human and AI-generated SPF individual forecast errors	Close reproduction	All 64 density curves agree closely with original vector shapes.	Direct Gaussian KDE replaces R FFT density evaluation; peak-height residuals are reported.
F6 · p. 44 SPF and AI-generated median forecast errors around the LLM training data cut-off date	Numerical match	All 8 plotted error series agree at PDF coordinate rounding.	The figure uses the OOS file for 2023-2024, including its overlapping 2023 observations.
T1 · p. 45 Forecasting variables	Source reproduced	All 23 variable definitions rebuilt from manuscript source.	Definitions are documentary content, not estimated quantities.
T2 · p. 46 Definitions of forecaster characteristics	Source reproduced	All 12 characteristic definitions rebuilt from source text.	Definitions are documentary content, not estimated quantities.

Comparison table | 2 of 3

Numerical and documentary agreement are assessed separately; all discrepancies are retained.

Item / original page	Result	Evidence	Method or data limitation
T3 · p. 47 Descriptive statistics of forecast variables	Numerical match	All 207 printed numeric cells match. Numeric cells: 207/207.	N=5,308 repeats realizations across forecasters; ACF uses stored row order rather than a unique quarterly series.
T4 · p. 48 Forecast accuracy of human and AI-generated SPF forecasts	Partial reproduction	Most MAEs match; many reported p-values do not. Numeric cells: 133/138. P-values: 9/69 match rounding. 13/69 within MC tolerance. Stars: 43/69.	Code weights quarters by panel size and tests signed mean errors, although the caption describes MAE differences.
T5 · p. 49 Percentage survey quarters where AI is more accurate than the human SPF	Partial reproduction	Most accuracy shares and randomization p-values match. Numeric cells: 67/69. P-values: 58/69 match rounding. 67/69 within MC tolerance. Stars: 69/69.	Two displayed shares differ. Code counts ties as AI wins and reports fractions rather than 0-100 percentages.
T6 · p. 50 Forecast accuracy of best human and AI SPF forecasters	Partial reproduction	All 138 MAEs match; one p-value exceeds the Monte Carlo comparison tolerance. Numeric cells: 138/138. P-values: 51/69 match rounding. 68/69 within MC tolerance. Stars: 67/69.	Code compares the best AI persona with the human MEDIAN on its quarters; the caption refers to the best human.
T7 · p. 51 Cross-Sectional Disagreement by Forecast Horizon	Match with caveat	All 40 displayed numeric cells match. Numeric cells: 40/40. Stars: 8/8.	Human horizons are actually 0/3; AI horizons are 1/4. Both panels are labeled 1/4 in the paper.
T8 · p. 52 Relative accuracy of AI forecasts with fewer prompt inputs	Partial reproduction	All 168 ratios, including averages, match; significance patterns differ. Numeric cells: 168/168. Stars: 119/161.	Code randomizes AI/Human within each ablation using signed means, not baseline/ablation MAE differences.
T9 · p. 53 AI Forecast Performance During Unexpected Events	Match with caveat	All 14 event Z-scores match. Numeric cells: 14/14.	Uses h0 for Flash Crash and h1 for other events, including the pre-deadline S&P downgrade; SD is of signed errors.
T10 · p. 54 AI Forecast Error Regressions on Knowledge Cut-Off Dummy Variable	Match with caveat	All 24 displayed coefficients, SEs, counts and R-squared values match. Numeric cells: 24/24. Stars: 8/8.	The 108 observations include duplicate 2023 quarters; there are 104 distinct quarters.

Comparison table | 3 of 3

Numerical and documentary agreement are assessed separately; all discrepancies are retained.

Item / original page	Result	Evidence	Method or data limitation
T11 · p. 54 Forecast Revision Regressions: Human vs AI	Not reproduced	Only AI observation counts match among the 64 numeric cells. Numeric cells: 8/64. Stars: 15/16.	Original calculation code is missing. Several plausible lag/consensus definitions fail to reproduce the published estimates.
T12 · p. 55 Reasoning Categories by Economic Period	Numerical match	All 28 counts and percentages match. Numeric cells: 28/28.	Requires all 5,388 raw responses, including 80 placeholder-name rows excluded from the main cleaned panel.
FA1 · p. 61 Number of forecasters in the SPF panel over time	Numerical match	Both 100-quarter count series match at PDF coordinate rounding.	AI counts require the older baseline workbook, not the current baseline used by most tables.
FA2 · p. 62 Duration of participation of each forecaster individual forecaster in the SPF panel over time	Partial reproduction	189 of 193 membership patterns match; both have 5,208 unique tiles.	Current metadata contain 5,236 records versus 5,232 in the original plotted asset.
TB13 · p. 64 Out-of-sample forecast accuracy (mean absolute errors) of SPF and AI-generated SPF forecasts	Match with caveat	All 138 MAEs match; all 69 p-values are compatible with Monte Carlo variation. Numeric cells: 138/138. P-values: 40/69 match rounding. 69/69 within MC tolerance. Stars: 68/69.	Uses 2023-2024 and h0/1/4, unlike printed labels. Saved h4 errors are unclipped where current preparation code clips; raw preprocessing is not fully reproduced.
TB14 · p. 65 Out-of-sample forecast accuracy (mean absolute errors) of best human and AI SPF fore- casters	Partial reproduction	Historical source reconstruction matches only part of the table. Numeric cells: 70/132. P-values: 18/66 match rounding. 30/66 within MC tolerance. Stars: 66/66.	Older AI data and 2024 target cutoff improve agreement; best AI is compared with human median. Current-data caption method also saved.
TD15 · p. 68 Forecast accuracy (mean absolute errors) of AI-generated and AR(1) SPF forecasts relative to human accuracy	Match with caveat	All 138 ratios, 69 p-values and 69 star patterns match. Numeric cells: 138/138. P-values: 69/69 match rounding. Stars: 69/69.	Reconstructed AR(1) begins with two lagged pairs; DM test uses absolute loss and test horizon 1 for every forecast horizon.

Methods and scope

Independent calculation

New results are calculated from supplied raw files and numerical R data objects. Raw Excel forecasts reconcile with cached AI values; baseline medians and clipped errors were independently verified. B.13 uses saved OOS errors: its h4 values differ from current preparation-code clipping, so that preprocessing is not fully reproduced. Existing tables/images are comparison references; documentary images and definitions are labeled source reproductions.

Execution environment

R and a LaTeX compiler were unavailable. Supplied R calculations were ported to Python; missing calculation scripts were reconstructed from the paper and archived data. The original R files were not changed. Existing LLM responses were analyzed; no new model responses or external API calls were generated.

Numeric comparisons

Printed values are checked at their displayed precision (normally half of 0.01). Counts and significance-star patterns are checked separately. The workbook records originals, recomputed values, absolute differences and tolerances for each audited table cell.

Randomized tests

Core randomization tests use 10,000 draws and seed 20261031. The original seed is absent. Exact displayed p-value matches and approximate compatibility are separate counts. Compatibility tolerance is max(0.015, 0.005 + 3 × sqrt(2p(1−p)/10000)); this is a diagnostic allowance, not proof of the same simulation. The AR(1) p-values are deterministic DM tests and are compared at printed precision.

Figure comparisons

Line-series checks compare independently generated data with PDF vector coordinates. Histogram bars and density curves are checked against the rendered/vector reference. Styling, smoothing and density numerical approximations are distinguished from changes in data or sample membership.

Files and scope

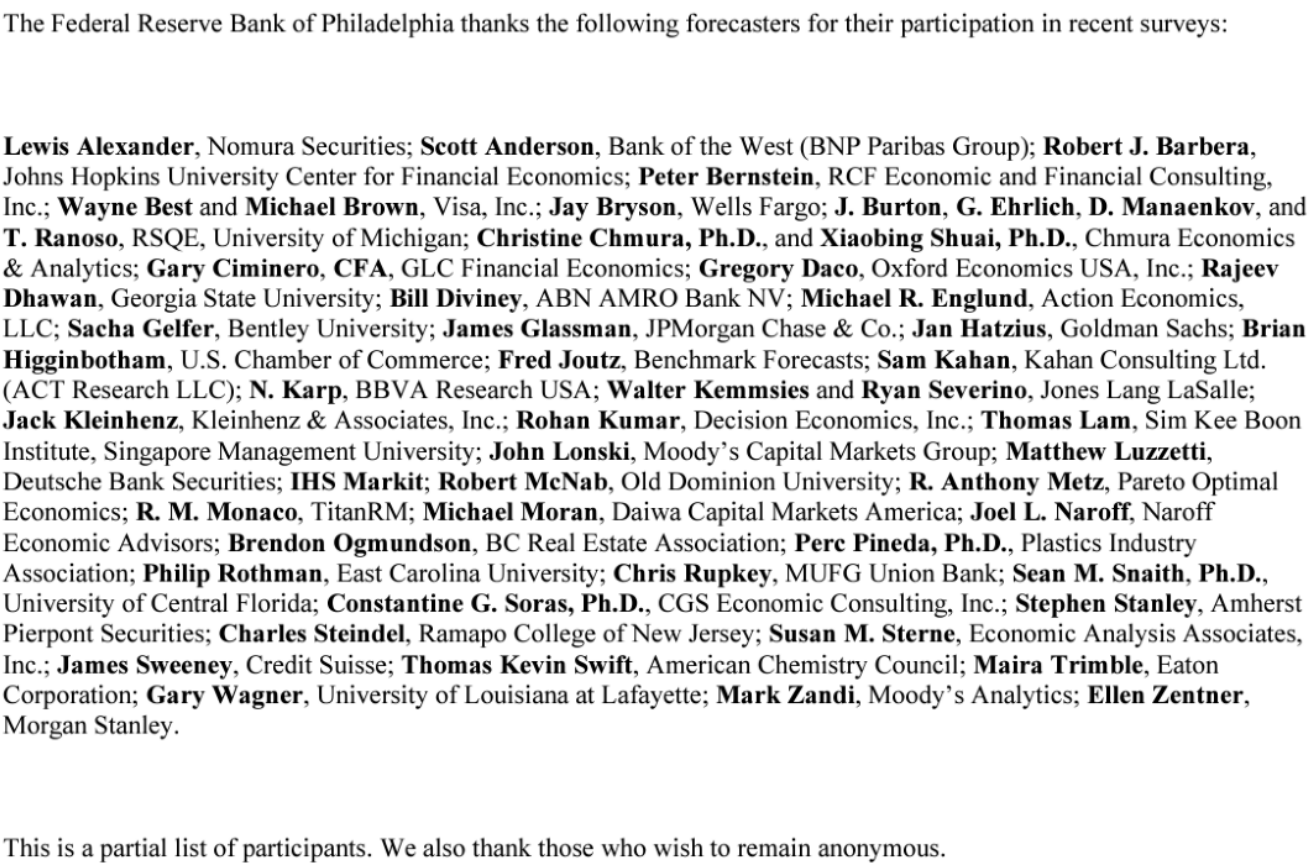

The companion workbook is the searchable comparison and cell audit. The replication folder contains scripts, numerical outputs, figure inputs, data provenance and source maps. The 5 numbered prompt exhibits are documentary prompt examples, not additional figures/tables, and are not included in the 23-item statistical inventory.

Screenshot from original PDF page 36 · Example of forecaster acknowledgments

Figure 1: Example of forecaster acknowledgments

The figure shows an example of acknowledgments to forecasters who contributed to recent Federal Reserve Bank of Philadelphia surveys.

The Federal Reserve Bank of Philadelphia thanks the following forecasters for their participation in recent surveys:

Lewis Alexander, Nomura Securities; **Scott Anderson**, Bank of the West (BNP Paribas Group); **Robert J. Barbera**, Johns Hopkins University Center for Financial Economics; **Peter Bernstein**, RCF Economic and Financial Consulting, Inc.; **Wayne Best** and **Michael Brown**, Visa, Inc.; **Jay Bryson**, Wells Fargo; **J. Burton**, **G. Ehrlich**, **D. Manaenkov**, and **T. Ranoso**, RSQE, University of Michigan; **Christine Chmura, Ph.D.**, and **Xiaobing Shuai, Ph.D.**, Chmura Economics & Analytics; **Gary Ciminero**, **CFA**, GLC Financial Economics; **Gregory Daco**, Oxford Economics USA, Inc.; **Rajeev Dhawan**, Georgia State University; **Bill Diviney**, ABN AMRO Bank NV; **Michael R. Englund**, Action Economics, LLC; **Sacha Gelfer**, Bentley University; **James Glassman**, JPMorgan Chase & Co.; **Jan Hatzius**, Goldman Sachs; **Brian Higginbotham**, U.S. Chamber of Commerce; **Fred Joutz**, Benchmark Forecasts; **Sam Kahan**, Kahan Consulting Ltd. (ACT Research LLC); **N. Karp**, BBVA Research USA; **Walter Kemmsies** and **Ryan Severino**, Jones Lang LaSalle; **Jack Kleinhenz**, Kleinhenz & Associates, Inc.; **Rohan Kumar**, Decision Economics, Inc.; **Thomas Lam**, Sim Kee Boon Institute, Singapore Management University; **John Lonski**, Moody's Capital Markets Group; **Matthew Luzzetti**, Deutsche Bank Securities; **IHS Markit**; **Robert McNab**, Old Dominion University; **R. Anthony Metz**, Pareto Optimal Economics; **R. M. Monaco**, TitanRM; **Michael Moran**, Daiwa Capital Markets America; **Joel L. Naroff**, Naroff Economic Advisors; **Brendon Ogmundson**, BC Real Estate Association; **Perc Pineda, Ph.D.**, Plastics Industry Association; **Philip Rothman**, East Carolina University; **Chris Rupkey**, MUFG Union Bank; **Sean M. Snaith**, **Ph.D.**, University of Central Florida; **Constantine G. Soras, Ph.D.**, CGS Economic Consulting, Inc.; **Stephen Stanley**, Amherst Pierpont Securities; **Charles Steindel**, Ramapo College of New Jersey; **Susan M. Sterne**, Economic Analysis Associates, Inc.; **James Sweeney**, Credit Suisse; **Thomas Kevin Swift**, American Chemistry Council; **Maira Trimble**, Eaton Corporation; **Gary Wagner**, University of Louisiana at Lafayette; **Mark Zandi**, Moody's Analytics; **Ellen Zentner**, Morgan Stanley.

Original | Figure 4

Screenshot from original PDF page 41 · Distribution of Forecaster Fixed Effects

Figure 4: Distribution of Forecaster Fixed Effects

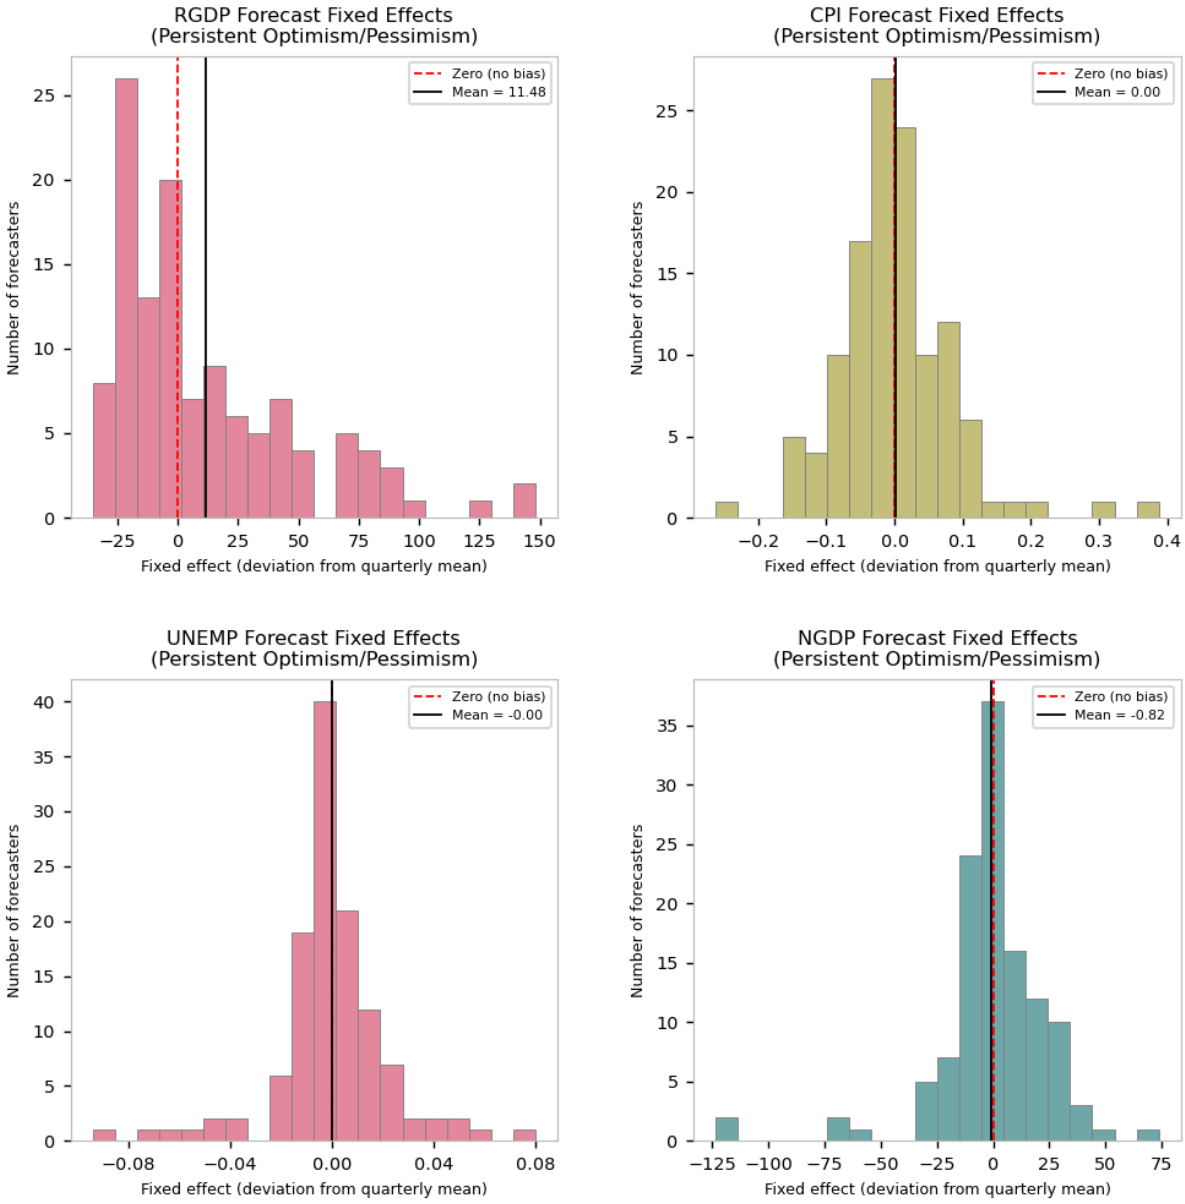

Notes: The figure shows the distribution of forecaster-specific fixed effects for four macroeconomic variables. Fixed effects are calculated as the average deviation of each forecaster's prediction from the quarterly cross-sectional mean. Each panel displays a histogram of fixed effects across 194 forecasters, with vertical lines indicating zero (red dashed) and the sample mean (black solid). RGDP and NGDP are measured in billions of 2012 dollars; CPI and UNEMP are measured in percentage points. Forecasters are restricted to those with at least 10 observations across the sample period (1999–2023).

Reproduced | Figure 4

Match with caveat

Figure 4. Distribution of forecaster fixed effects

Reconstructed from raw AI nowcasts: retain forecasters with at least ten valid observations, then subtract quarterly cross-sectional means and average each forecaster's deviations.

Recovered calculation matches the published histogram means and shapes. Actual retained sample: 121 forecasters; the caption's 194 is the count before the ten-observation restriction. Horizon and restriction order were omitted from the paper; both are documented here.

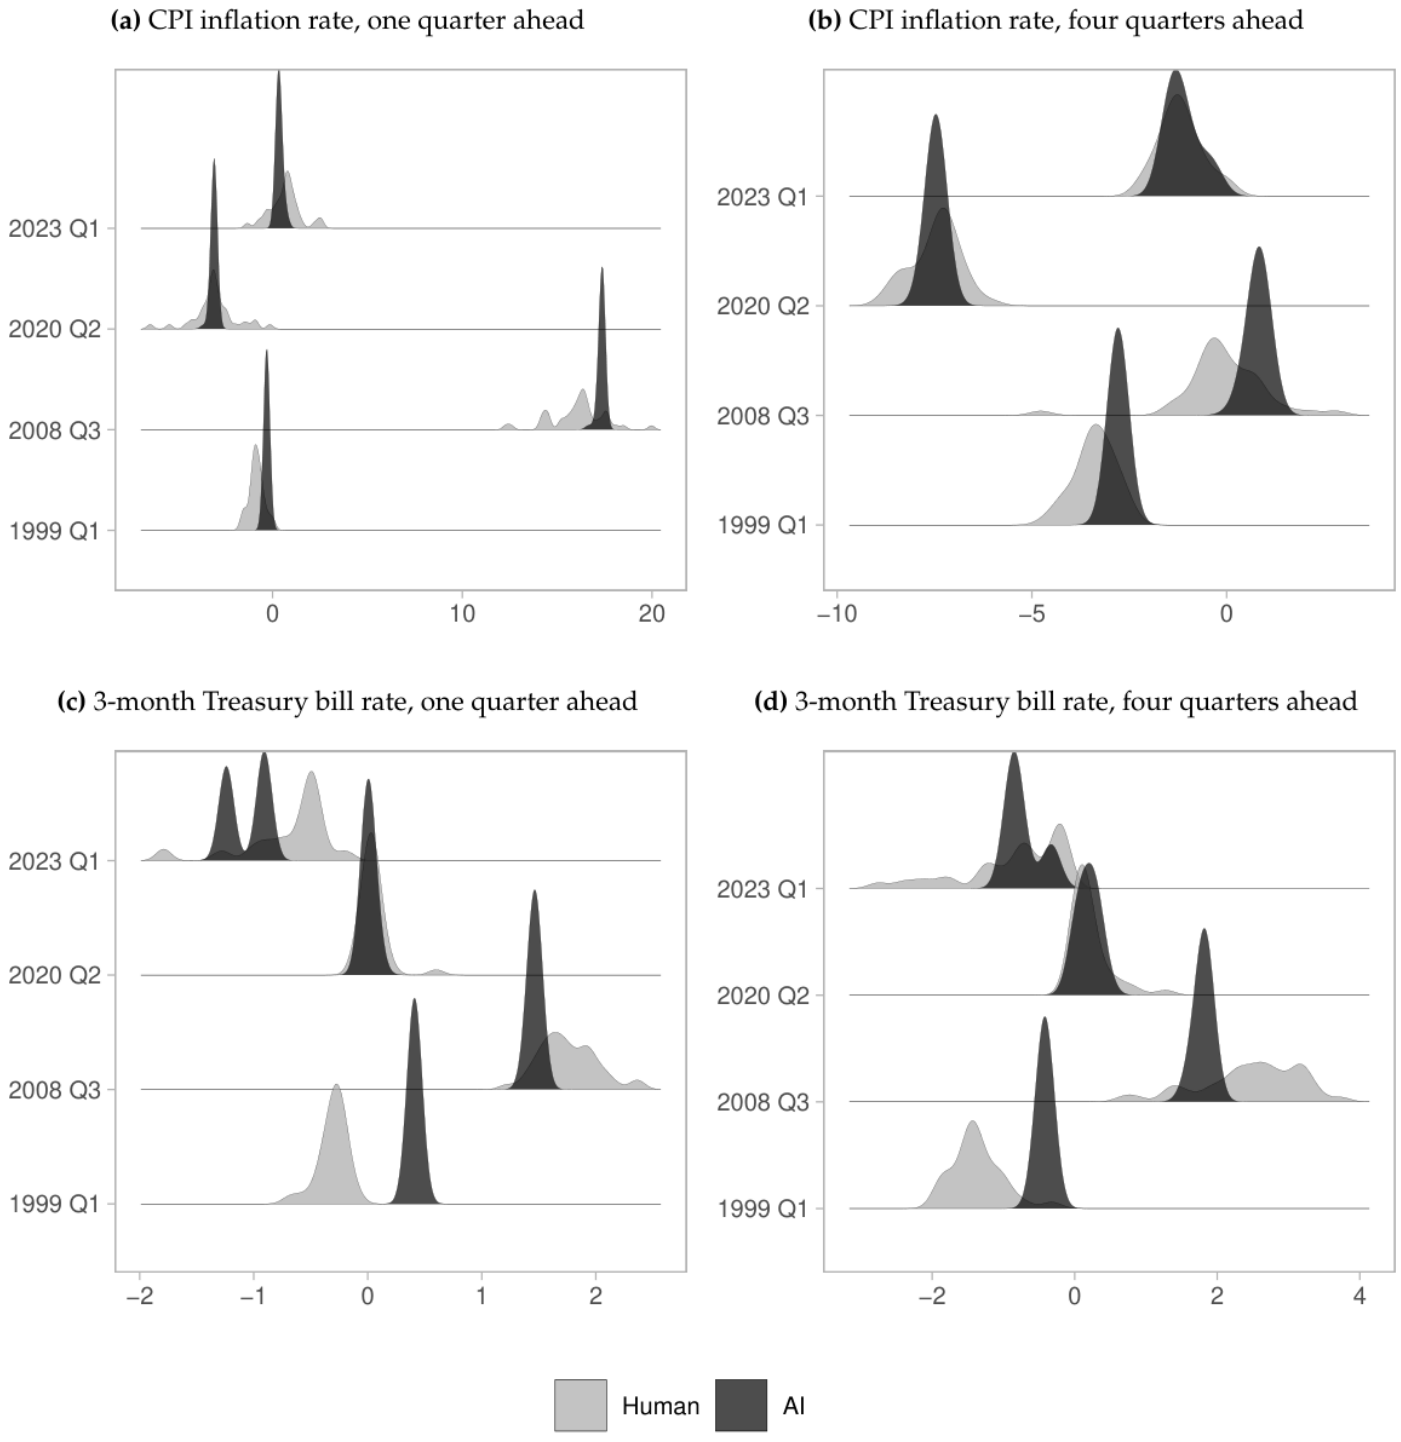

Filtering before demeaning yields 121 forecasters; caption states 194. Generating code was absent.

Original | Figure 5 | part 1 of 2

Screenshot from original PDF page 42 · Densities of human and AI-generated SPF individual forecast errors

Figure 5: Densities of human and AI-generated SPF individual forecast errors

The figure shows densities centered around realized variables of human and AI-generated SPF forecasts across individual forecasters for four different quarters. The densities are shown for the following variables and forecasting horizons: (a) CPI inflation rate one quarter ahead, (b) CPI inflation rate four quarters ahead, (c) 3-month Treasury bill rate one quarter ahead, (d) 3-month Treasury bill rate four quarters ahead, (e) unemployment rate one quarter ahead, (f) unemployment rate four quarters ahead, (g) real GDP index one quarter ahead, and (h) real GDP index four quarters ahead.

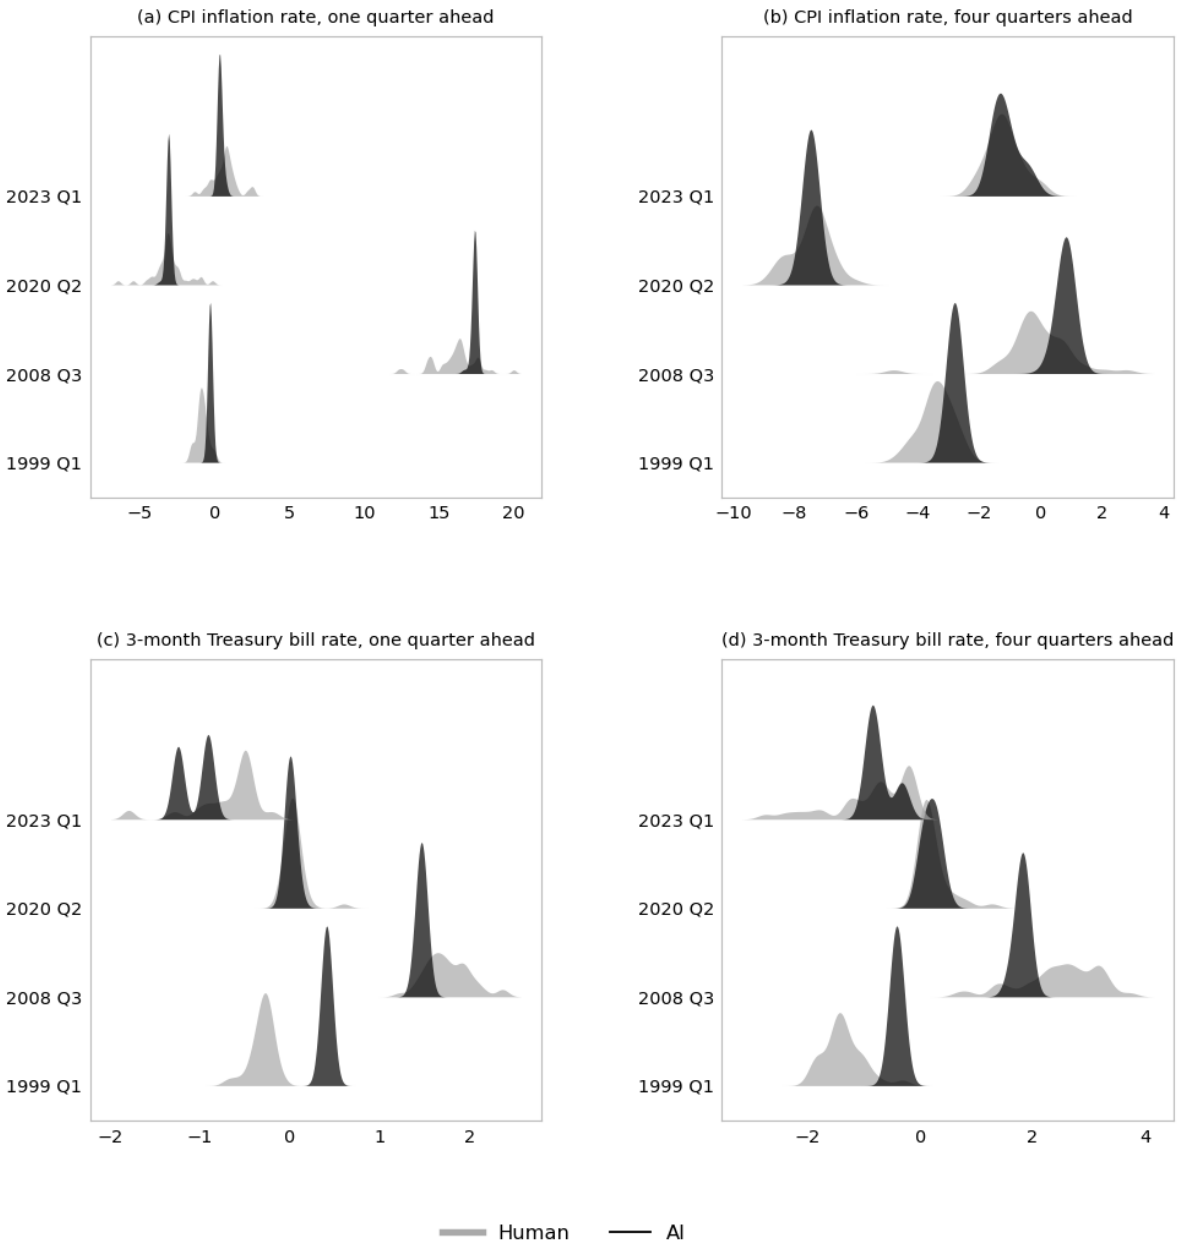

(Figure continues on next page)

Reproduced | Figure 5 | part 1 of 2

Close reproduction

Figure 5. Densities of human and AI forecast errors

Individual forecast distributions centered on realized values for four selected quarters. Original panel order and horizons are retained.

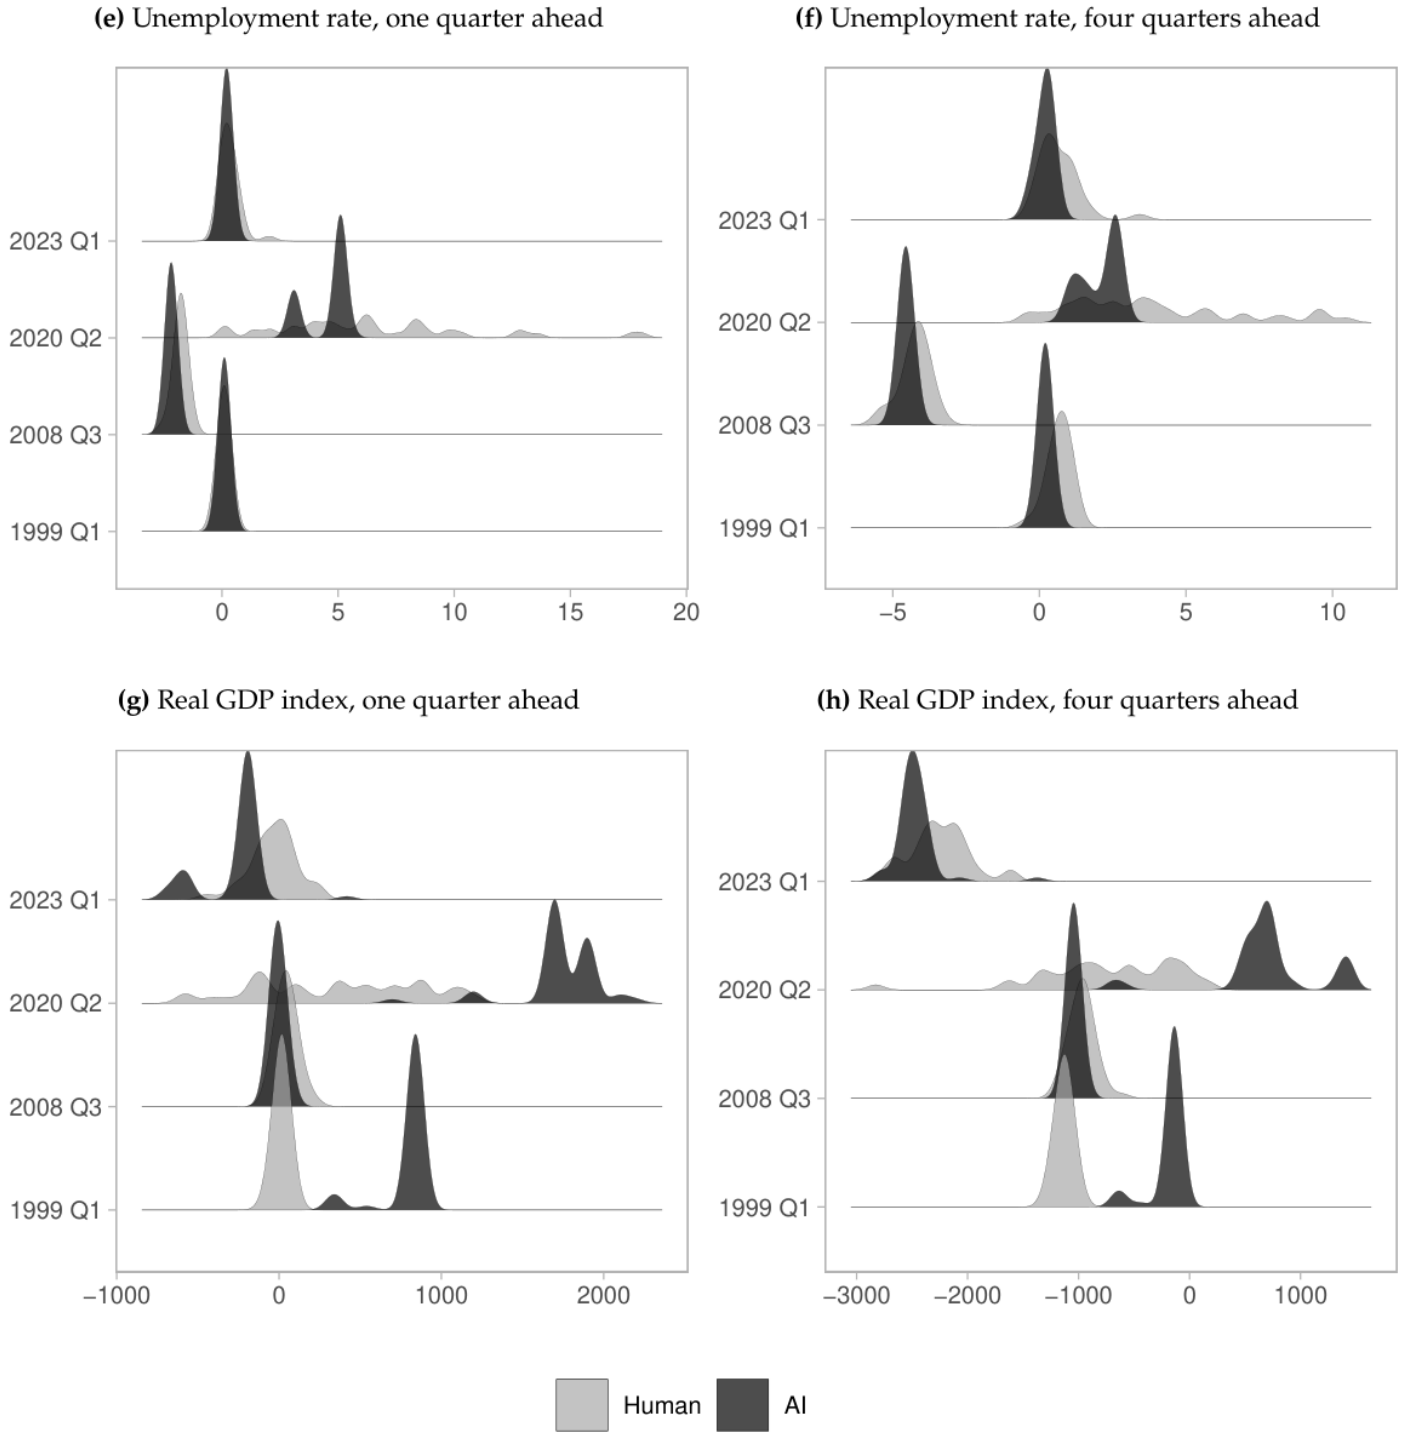

Recomputed Gaussian kernel densities with a common R nrd0 bandwidth for the groups in each panel. Forecast-error samples and numerical distribution summaries are exported.

Direct Gaussian KDE replaces R FFT density evaluation; peak-height residuals are reported.

Screenshot from original PDF page 44 · SPF and AI-generated median forecast errors around the LLM training data cut-off date

Figure 6: SPF and AI-generated median forecast errors around the LLM training data cut-off date

The figure shows the errors of one-quarter human and AI-generated SPF median forecasts for the (a) CPI inflation rate, (b) 3-month Treasury bill rate, (c) unemployment rate, and (d) real GDP index. The dashed line indicates October 2023, the training data cut-off date of the LLM (GPT-4o mini).

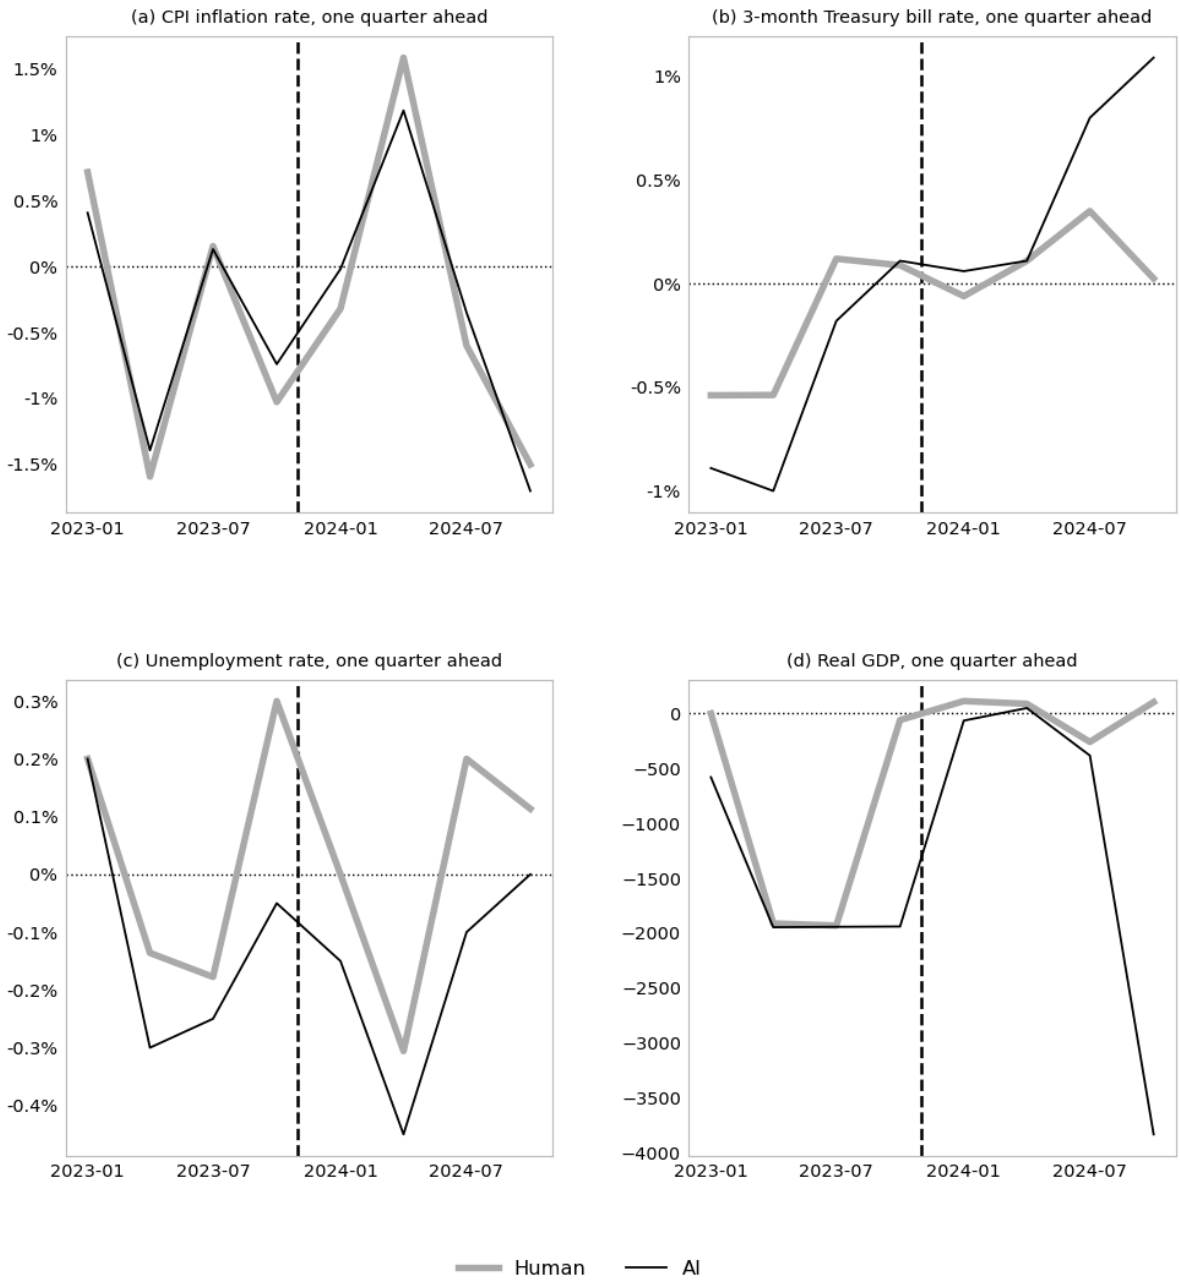

Reproduced | Figure 6

Numerical match

Figure 6. Median forecast errors around the training cutoff

One-quarter-ahead median forecast errors. The dashed line indicates October 2023, the stated GPT-4o mini training-data cutoff.

Out-of-sample run, including its 2023 survey quarters. Errors use the supplied R rule: median forecast, clipped to realized mean ±3 SD, less realized value. Display starts at 2023Q1 to match the final PDF.

The figure uses the OOS file for 2023-2024, including its overlapping 2023 observations.

Original | Table 1

Screenshot from original PDF page 45 · Forecasting variables

Table 1: Forecasting variables

The table lists the variables for which the SPF panel provides point forecasts and their definitions.

Variable	Definition
Section 1: U.S. Business Indicators	
NGDP	Nominal Gross Domestic Product (GDP), levels, seasonally adjusted, annual rate, in billions USD.
PGDP	Gross Domestic Product (GDP) price index, chain weighted, seasonally adjusted, 2010 base year.
CPROF	Level of nominal corporate profits after tax excluding inventory valuation adjustment (IVA) and capital consumption adjustment (CCAdj). Seasonally adjusted, annual rate, in billions USD.
UNEMP	Civilian unemployment rate, levels, seasonally adjusted, percentage points.
EMP	Nonfarm payroll employment, seasonally adjusted, in thousands of jobs.
INDPROD	Industrial production index, seasonally adjusted, index, 2010 base year.
HOUSING	Housing starts, seasonally adjusted, annual rate, in millions.
TBILL	T-Bill rate, 3-month, levels, percentage points.
BOND AAA	AAA corporate bond yield, levels, percentage points.
BOND BAA	BAA corporate bond yield, levels, percentage points.
TBOND	Treasury bond rate, 10-year, levels, percentage points.
Section 2: Real GDP and Its Components	
RGDP	Real Gross Domestic Product, seasonally adjusted, annual rate, 2010 base year.
RCONSUM	Real personal consumption expenditures, seasonally adjusted, annual rate, 2010 base year.
RNRESIN	Real nonresidential fixed investment, seasonally adjusted, annual rate, 2010 base year.
RRESINV	Real residential fixed investment, seasonally adjusted, annual rate, 2010 base year.
RFEDGOV	Real federal government consumption and gross investment, seasonally adjusted, annual rate, 2010 base year.
RSLGOV	Real state and local government consumption and gross investment, seasonally adjusted, annual rate, 2010 base year.
RCBI	Real change in private inventories, levels, chain-weighted real change in private inventories. Seasonally adjusted, annual rate, 2010 base year.
REXPORT	Real net exports of goods and services, levels, chain-weighted real net exports. Seasonally adjusted, annual rate, 2010 base year.
Section 3: CPI and PCE Inflation	
CPI	Headline CPI inflation rate, seasonally adjusted, annual rate, percentage points.
CORECPI	Core CPI inflation rate, seasonally adjusted, annual rate, percentage points.
PCE	PCE inflation rate, headline chain-weighted, seasonally adjusted, annual rate, percentage points.
COREPCE	Core PCE inflation rate, core chain-weighted PCE inflation rate, seasonally adjusted, annual rate, percentage points.

Original | Table 2

Screenshot from original PDF page 46 · Definitions of forecaster characteristics

Table 2: Definitions of forecaster characteristics

The table shows definitions of forecaster characteristics, including inferred gender, affiliation, education, position, and public media engagement. The table is based on publicly available sources and may not fully capture the breadth of forecaster characteristics.

Characteristic	Description
Name	Full name of the forecaster as listed in the SPF acknowledgement panel.
Gender (inferred)	Gender inferred based on publicly available information (e.g., name, social media).
Affiliation	The institution or company the forecaster is associated with (e.g., university, bank).
Affiliation type	Type of organization the forecaster works for, such as academic, financial, forecasting center, government, etc.
Position in given year	The forecaster's job title or role when the forecast was made (e.g., professor, economist).
Highest degree earned	The highest degree the forecaster has earned (e.g., Bachelor, Master, PhD).
Degree area/field	The field of study for the forecaster's degree (e.g., Economics, Finance).
Graduation year	The year the forecaster completed their highest degree, used to estimate experience and age.
Alma mater	The institution where the forecaster earned their highest degree.
Company location	The geographic location of the forecaster's affiliated institution or company.
Gives interviews	Whether the forecaster gives public interviews or engages with media (yes/no).
Has Twitter	Whether the forecaster has a public Twitter profile (yes/no).

Faithful port of tab_descriptive_stats.R. Realizations repeat once per AI panel row (N=5,308), not once per quarter. ACF follows stored row order; e1071 type-3 moments are used. Series marked x1000 are divided by 1,000.

N=5,308 repeats realizations across forecasters; ACF uses stored row order rather than a unique quarterly series.

Table 4: Forecast accuracy of human and AI-generated SPF forecasts

The table shows forecast accuracy reported as mean absolute errors computed as the average of absolute differences between realized values and median human and AI-generated SPF forecasts across survey quarters. Accuracy is reported for different forecast horizons, with 0, 1 and 4 denoting nowcast, one quarter and four quarters ahead, respectively. For each forecasting horizon, the table boldfaces the lowest MAE value between the AI and human surveys. The P-val column reports p-values and significance levels for randomized tests of the statistical significance of the difference between AI and human MAEs. The tests are based on 10,000 random draws. Significance levels: * p-value≤0.10, ** p-value≤0.05, *** p-value≤0.01.

Supplied code: MAEs weighted by AI panel row counts through a duplicate join; randomization tests use signed mean errors, although the paper describes MAE tests. 10,000 draws, seed 20261031.

Code weights quarters by panel size and tests signed mean errors, although the caption describes MAE differences.

Original | Table 5

Screenshot from original PDF page 49 · Percentage survey quarters where AI is more accurate than the human SPF

Table 5: Percentage survey quarters where AI is more accurate than the human SPF

The table shows forecast accuracy in terms of the percentage of survey quarters where the AI-generated SPF has lower forecast errors than the human SPF (Pct). Forecast errors are computed as the differences between realized values and median human and AI-generated SPF forecasts. Values are reported for different forecast horizons, with 0, 1 and 4 denoting nowcast, one quarter and four quarters ahead, respectively. The table boldfaces values above 50%. The P-val column reports p-values and significance levels for randomized tests of the percentages being equal to 50%. The tests are based on 10,000 random draws. Significance levels: * p-value≤0.10, ** p-value≤0.05, *** p-value≤0.01.

Core PCE Inflation Rate	0.50	1.00	0.44	0.46	0.55	0.53

Shares count ties as AI wins, following the supplied R code; fractions are displayed (0.50 = 50%). Tests use 10,000 label swaps, seed 20261031.

Two displayed shares differ. Code counts ties as AI wins and reports fractions rather than 0-100 percentages.

Table 6: Forecast accuracy of best human and AI SPF forecasters

The table shows forecast accuracy reported as mean absolute errors computed as the average of absolute differences between realized values and the best human and AI-generated SPF forecasts across survey quarters. The best forecast is computed from the forecaster that achieves lowest average error across survey quarters. These best forecasters are identified separately for each variable and horizon. Accuracy is reported for different forecast horizons, with 0, 1 and 4 denoting nowcast, one quarter and four quarters ahead, respectively. For each forecasting horizon, the table boldfaces the lowest MAE value between the AI and human surveys. The P-val column reports p-values and significance levels for randomized tests of the statistical significance of the difference between AI and human MAEs. The tests are based on 10,000 random draws. Significance levels: * p-value≤0.10, ** p-value≤0.05, *** p-value≤0.01.

Supplied code selects best AI persona across time, then compares the human MEDIAN on that persona’s quarters; it does not select the best human. Selection uses duplicate-join weights. Positional randomization is ported from R.

Code compares the best AI persona with the human MEDIAN on its quarters; the caption refers to the best human.

Panel: AI					
CPI	0.266	0.253	0.95	-0.64	94
UNEMP	0.075	0.115	1.53	4.88***	72
RGDP	122.3	171.0	1.40	9.14***	91
TBILL	0.069	0.116	1.68	6.28***	73

Computed from raw forecasts, 1999–2023. Sample standard deviations (ddof=1); only quarters with positive SD at both horizons are retained. Paired two-sided t-tests compare long minus short SD; *** p<0.01. All 40 displayed numeric cells match the PDF. Indexing discrepancy: matching the printed Human panel requires current-quarter and three-quarter-ahead forecasts (SPF columns 2 and 5); the AI panel uses one- and four-quarter-ahead forecasts. The PDF labels both panels h+1/h+4.

Human horizons are actually 0/3; AI horizons are 1/4. Both panels are labeled 1/4 in the paper.

Original | Table 8

Screenshot from original PDF page 52 · Relative accuracy of AI forecasts with fewer prompt inputs

Table 8: Relative accuracy of AI forecasts with fewer prompt inputs

The table shows the accuracy of AI forecasts generated by prompts that provide less information relative to the accuracy of baseline AI forecasts (ratio). Forecast accuracy is computed as mean absolute errors, i.e., the average of absolute differences between realized values and the median human or AI-generated SPF forecasts across survey quarters. The "Generic" forecast uses a prompt that does not provide forecaster characteristics, but does provide real-time data and past median SPF forecasts. The "Generic, w/o real-time data" excludes both forecaster characteristics and real-time data from the prompt. "Generic, w/o real-time data, w/o past SPF data" excludes all data from the prompt including forecaster characteristics, real-time data, and past median SPF forecasts. Finally "Recall" prompts the model to recall values from the training data rather than forecasting values. Values exceeding one (boldfaced) indicate less accuracy compared with the baseline AI forecaster seeded with forecaster characteristics, real-time data, and past median SPF forecasts. Randomized tests evaluate whether values are significantly different from one. The tests are based on 10,000 random draws. Significance levels: * p-value≤0.10, ** p-value≤0.05, *** p-value≤0.01.

Ratios follow supplied code (unweighted quarterly MAEs). Stars use its signed-mean test and swap AI/Human within each ablation, not baseline/ablation labels. Recall cache combines older recall data with later BAA values.

Code randomizes AI/Human within each ablation using signed means, not baseline/ablation MAE differences.

Original | Table 9

Screenshot from original PDF page 53 · AI Forecast Performance During Unexpected Events

Table 9: AI Forecast Performance During Unexpected Events

The table shows the performance of AI forecasters during seven unexpected events occurring immediately before or after the deadline of the SPF survey (days after survey deadline denoted in parenthesis after the event date). The table reports average Z-scores, measuring the difference between the event-period forecast error and the mean forecast error across the full sample, divided by the standard deviation of the full-sample forecast error. Z-scores near zero indicate typical forecast difficulty, while highly negative values (e.g., <-1) would indicate suspiciously accurate predictions suggesting look-ahead bias. The Z-scores are averaged across the relevant variables for each event and across all variables.

Event	Event Date	Relevant Variables	Average Z-Score	
			Relevant Variables	All Variables
9/11 Attacks	2001-09-11 (27 days)	RGDP, UNEMP, CPI, TBILL, TBOND	0.28	0.01
Lehman Brothers Collapse	2008-09-15 (39 days)	RGDP, UNEMP, CPI, TBILL, TBOND, HOUSING	1.49	0.49
Flash Crash	2010-05-06 (-5 days)	RGDP, CPI	0.00	-0.12
S&P Downgrade of U.S. Debt	2011-08-05 (-3 days)	TBILL, TBOND, RGDP	0.26	-0.06
COVID-19 Pandemic Declaration	2020-03-11 (29 days)	RGDP, UNEMP, CPI, HOUSING, INDPROD	1.19	0.77
Russia-Ukraine War	2022-02-24 (17 days)	RGDP, CPI, TBILL, TBOND	0.72	0.29
Silicon Valley Bank Collapse	2023-03-10 (31 days)	RGDP, UNEMP, TBILL, TBOND	-0.20	-0.09

Reproduced | Table 9

Match with caveat

Table 9. AI forecast performance during unexpected events

Event / quarter / horizon	Event date (days after deadline)	Relevant variables	Relevant Z	All-variable Z
9/11 Attacks (2001 Q3; h1)	2001-09-11 (27 days)	RGDP, UNEMP, CPI, TBILL, TBOND	0.28	0.01
Lehman Brothers Collapse (2008 Q3; h1)	2008-09-15 (39 days)	RGDP, UNEMP, CPI, TBILL, TBOND, HOUSING	1.49	0.49
Flash Crash (2010 Q2; h0)	2010-05-06 (-5 days)	RGDP, CPI	0.00	-0.12
S&P Downgrade of U.S. Debt (2011 Q3; h1)	2011-08-05 (-3 days)	TBILL, TBOND, RGDP	0.26	-0.06
COVID-19 Pandemic Declaration (2020 Q1; h1)	2020-03-11 (29 days)	RGDP, UNEMP, CPI, HOUSING, INDPROD	1.19	0.77
Russia-Ukraine War (2022 Q1; h1)	2022-02-24 (17 days)	RGDP, CPI, TBILL, TBOND	0.72	0.29
Silicon Valley Bank Collapse (2023 Q1; h1)	2023-03-10 (31 days)	RGDP, UNEMP, TBILL, TBOND	-0.20	-0.09

Recomputed from supplied median AI forecast errors, 1999-2023. Z = (absolute event error - mean absolute error) / SD of signed error, separately by variable and horizon. Relevant-variable and all-variable scores are arithmetic means. Event dates and days after the survey deadline are documentary metadata from manuscript Table 9. Deadline offsets have not been independently validated: the supplied deadline cache identifies months, not exact days. Negative offsets indicate events before the deadline. The matching calculation uses h=0 for the Flash Crash and h=1 for every other event. The S&P downgrade therefore uses h=1 even though it preceded its survey deadline; applying the stated pre-deadline nowcast rule instead produces 0.38 for its relevant-variable score.

Uses h0 for Flash Crash and h1 for other events, including the pre-deadline S&P downgrade; SD is of signed errors.

Screenshot from original PDF page 54 · AI Forecast Error Regressions on Knowledge Cut-Off Dummy Variable

Table 10: AI Forecast Error Regressions on Knowledge Cut-Off Dummy Variable

The table reports OLS regressions of absolute forecast errors of AI forecasters at the one-quarter ahead horizon on a dummy variable, $I_{t>\text{Oct 2023}}$, that takes value one after the LLM knowledge cut-off date (October 2023). $^{***}p < 0.001$, $^{**}p < 0.01$, $^{*}p < 0.05$. Standard errors in parentheses.

	RGDP	UNEMP	CPI	TBILL
Intercept	366.06***	0.714***	2.135***	0.652***
	(65.43)	(0.141)	(0.210)	(0.076)
$I_{t>\text{Oct 2023}}$	715.56*	−0.539	−1.323	−0.137
	(340.01)	(0.732)	(1.091)	(0.397)

Observations	108	108	108	108
R^2	0.040	0.005	0.014	0.001

OLS with intercept and a dummy for survey dates after October 31, 2023; one-quarter-ahead absolute AI median errors. Conventional OLS standard errors. Significance: * p<.05; ** p<.01; *** p<.001. Exact reproduction requires concatenating the 100-quarter baseline and 8-quarter OOS files, including duplicate 2023 survey quarters: 108 observations but 104 distinct quarters. The four post-cutoff observations are 2024Q1-Q4.

The 108 observations include duplicate 2023 quarters; there are 104 distinct quarters.

Original | Table 11

Screenshot from original PDF page 54 · Forecast Revision Regressions: Human vs AI

Table 11: Forecast Revision Regressions: Human vs AI

The table reports OLS regressions of forecast revisions on lagged forecast errors (Error Correction) and distance from SPF consensus (Consensus Tracking). Revision_{it} is the change in forecaster i's nowcast from $t-1$ to t. SPF regressions use individual forecaster microdata from the Philadelphia Fed (1999–2023). Robust standard errors in parentheses. $^{***}p < 0.01$.

AI / TBILL	0.581***	0.007	5188	0.775	-1.077***	0.009	5188	0.800

The original computation script is absent. This reconstruction uses supplied nowcasts: revision = forecast(t) - previous available forecast; lagged error = previous realization - previous forecast; consensus deviation = previous forecast - previous human SPF median. OLS includes an intercept and HC1 standard errors. Recalculated significance: *** p<0.01, following the original table. AI uses all raw responses, including the placeholder name, while human IDs come from supplied SPF microdata. Published coefficients, standard errors, human observation counts and most R^2 values are not reproduced. AI N=5,188 is reproduced. Gaps and duplicate name-quarter observations are retained as supplied and counted in the numeric audit. The body says within-panel consensus whereas the caption says SPF consensus; the alternative within-panel estimates are also retained in the numeric file and do not reproduce the target. Alternate lag, realization-vintage and legacy-input checks did not identify the published estimator. This is an explicitly qualified reconstruction, not a confirmed replication.

Original calculation code is missing. Several plausible lag/consensus definitions fail to reproduce the published estimates.

Original | Table 12

Screenshot from original PDF page 55 · Reasoning Categories by Economic Period

Table 12: Reasoning Categories by Economic Period

Percentage of forecaster responses containing each reasoning type. Categories are non-exclusive. *Detailed categories*: Mechanical (trends, historical patterns, mean-reversion); Policy (Fed actions, fiscal/monetary policy); Model (economic theory such as Phillips curve, Okun's law); Event (specific shocks or crises). *ECB aggregation*: Following ECB methodology, Model-Based combines Mechanical ∪ Model; Judgment-Based combines Policy ∪ Event. All differences between crisis and normal periods are statistically significant ($p < 0.001$).

		Detailed Categories				ECB Aggregation	
Period	**N**	Mechanical	Policy	Model	Event	Model-Based	Judgment-Based
Normal	4,626	98.6%	55.2%	86.7%	19.7%	99.6%	63.3%
Financial Crisis	346	84.7%	34.4%	37.6%	82.4%	88.4%	87.6%
COVID-19	204	72.1%	59.8%	26.5%	77.0%	72.5%	79.9%
Inflation Shock	212	85.4%	87.3%	97.2%	30.2%	98.1%	87.7%

Reproduced | Table 12

Numerical match

Table 12. Reasoning categories by economic period

Period	N	Mechanical	Policy	Model	Event	Model-based	Judgment
Normal	4626	98.6%	55.2%	86.7%	19.7%	99.6%	63.3%
Financial Crisis	346	84.7%	34.4%	37.6%	82.4%	88.4%	87.6%
COVID-19	204	72.1%	59.8%	26.5%	77.0%	72.5%	79.9%
Inflation Shock	212	85.4%	87.3%	97.2%	30.2%	98.1%	87.7%

Recomputed using all 5,388 source reasoning responses, including the 80 rows named "No Name Provided". Nonexclusive case-insensitive substring matches use the exact Appendix C keyword lists. Model-based = Mechanical OR Model; Judgment-based = Policy OR Event. Financial Crisis: 2008Q3-2009Q4; COVID-19: 2020Q1-Q4; Inflation Shock: 2022Q1-Q4; otherwise Normal. Counts and all percentages match the final paper at its printed precision.

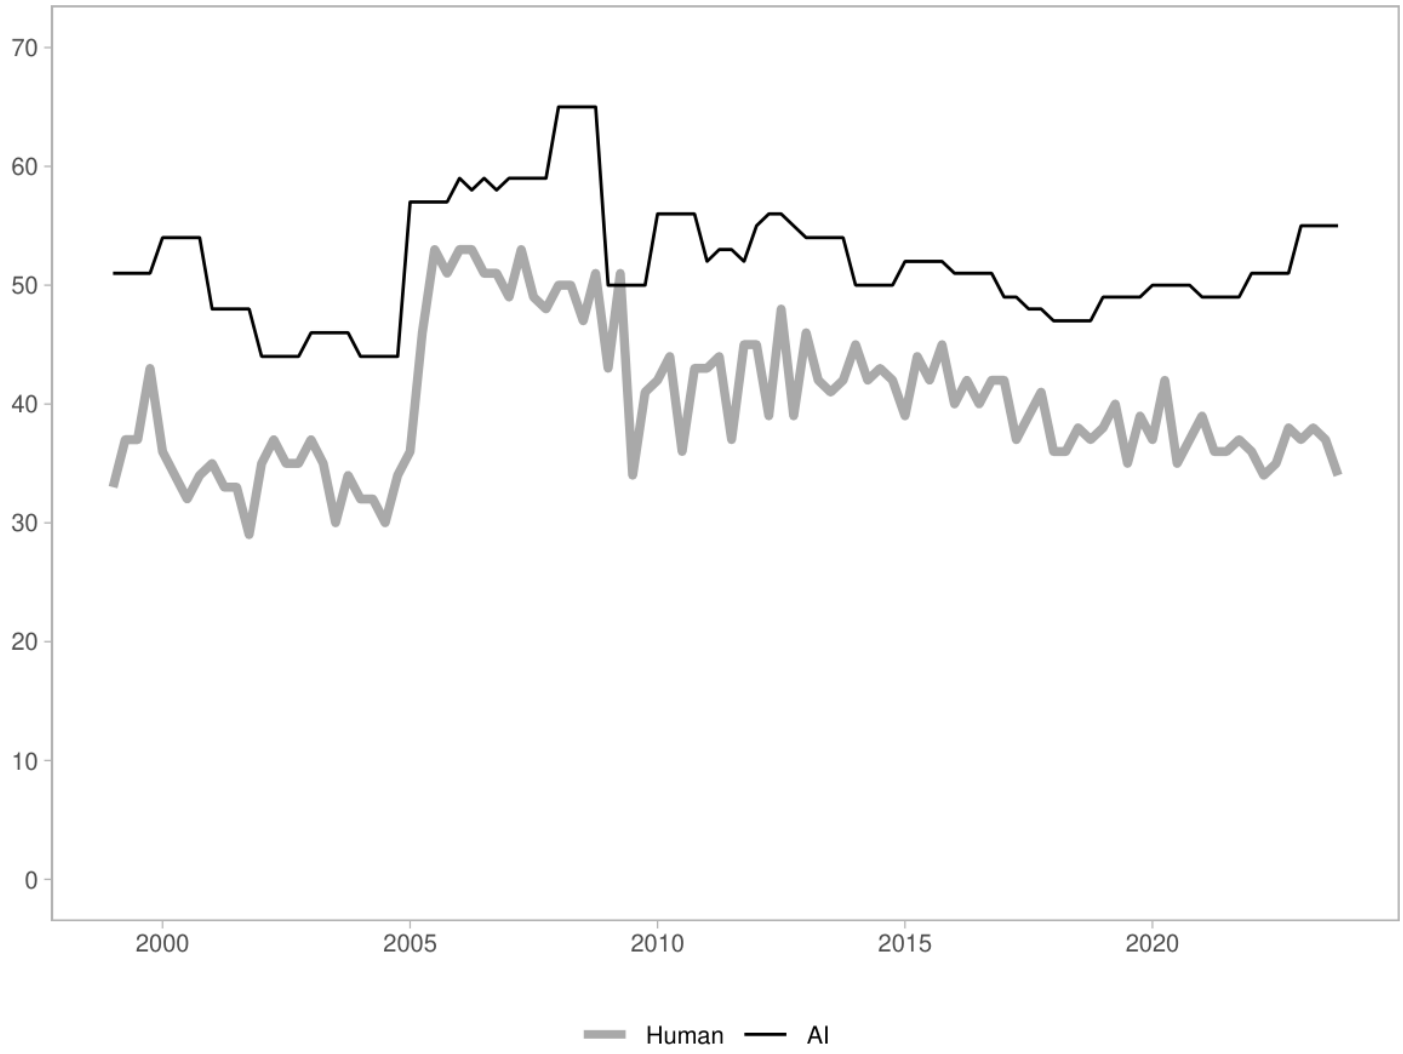

Requires all 5,388 raw responses, including 80 placeholder-name rows excluded from the main cleaned panel.

Original | Figure A.1

Screenshot from original PDF page 61 · Number of forecasters in the SPF panel over time

Figure A.1: Number of forecasters in the SPF panel over time

The figure shows the number of human and AI forecasters in the SPF panel over time. The number of human forecasters is averaged across variables and forecasting horizons.

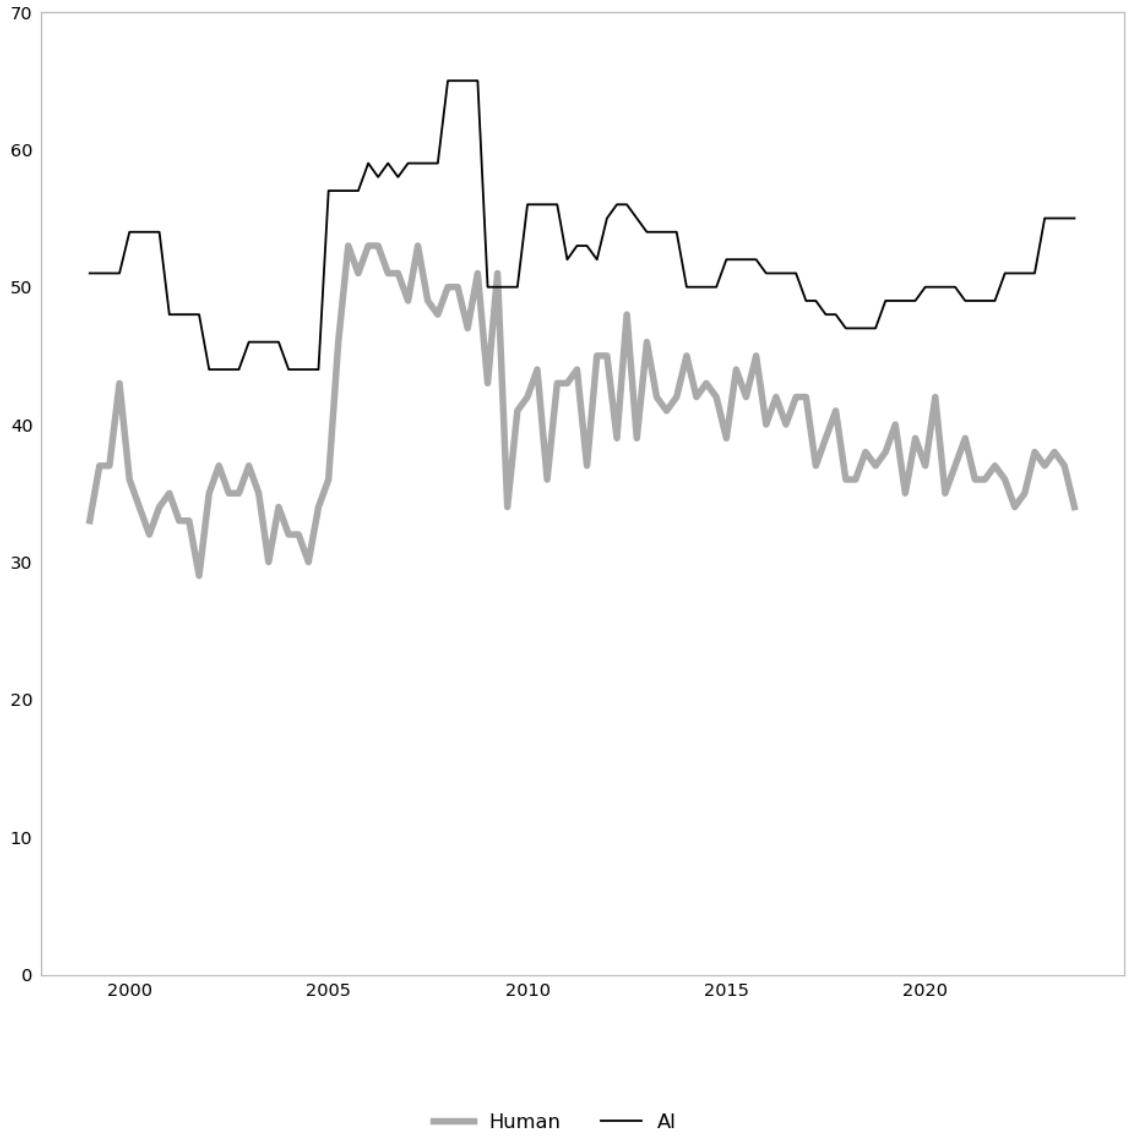

Reproduced | Figure A.1

Numerical match

Figure A.1. Number of forecasters over time

AI participant counts from the original multivariable_SPF6.xlsx run; human SPF counts averaged across variables and horizons.

The final PDF uses the older multivariable_SPF6.xlsx participant panel (5,188 rows after excluding No Name Provided), rather than the later baseline cache (5,308 rows). Both source curves match at vector rounding precision.

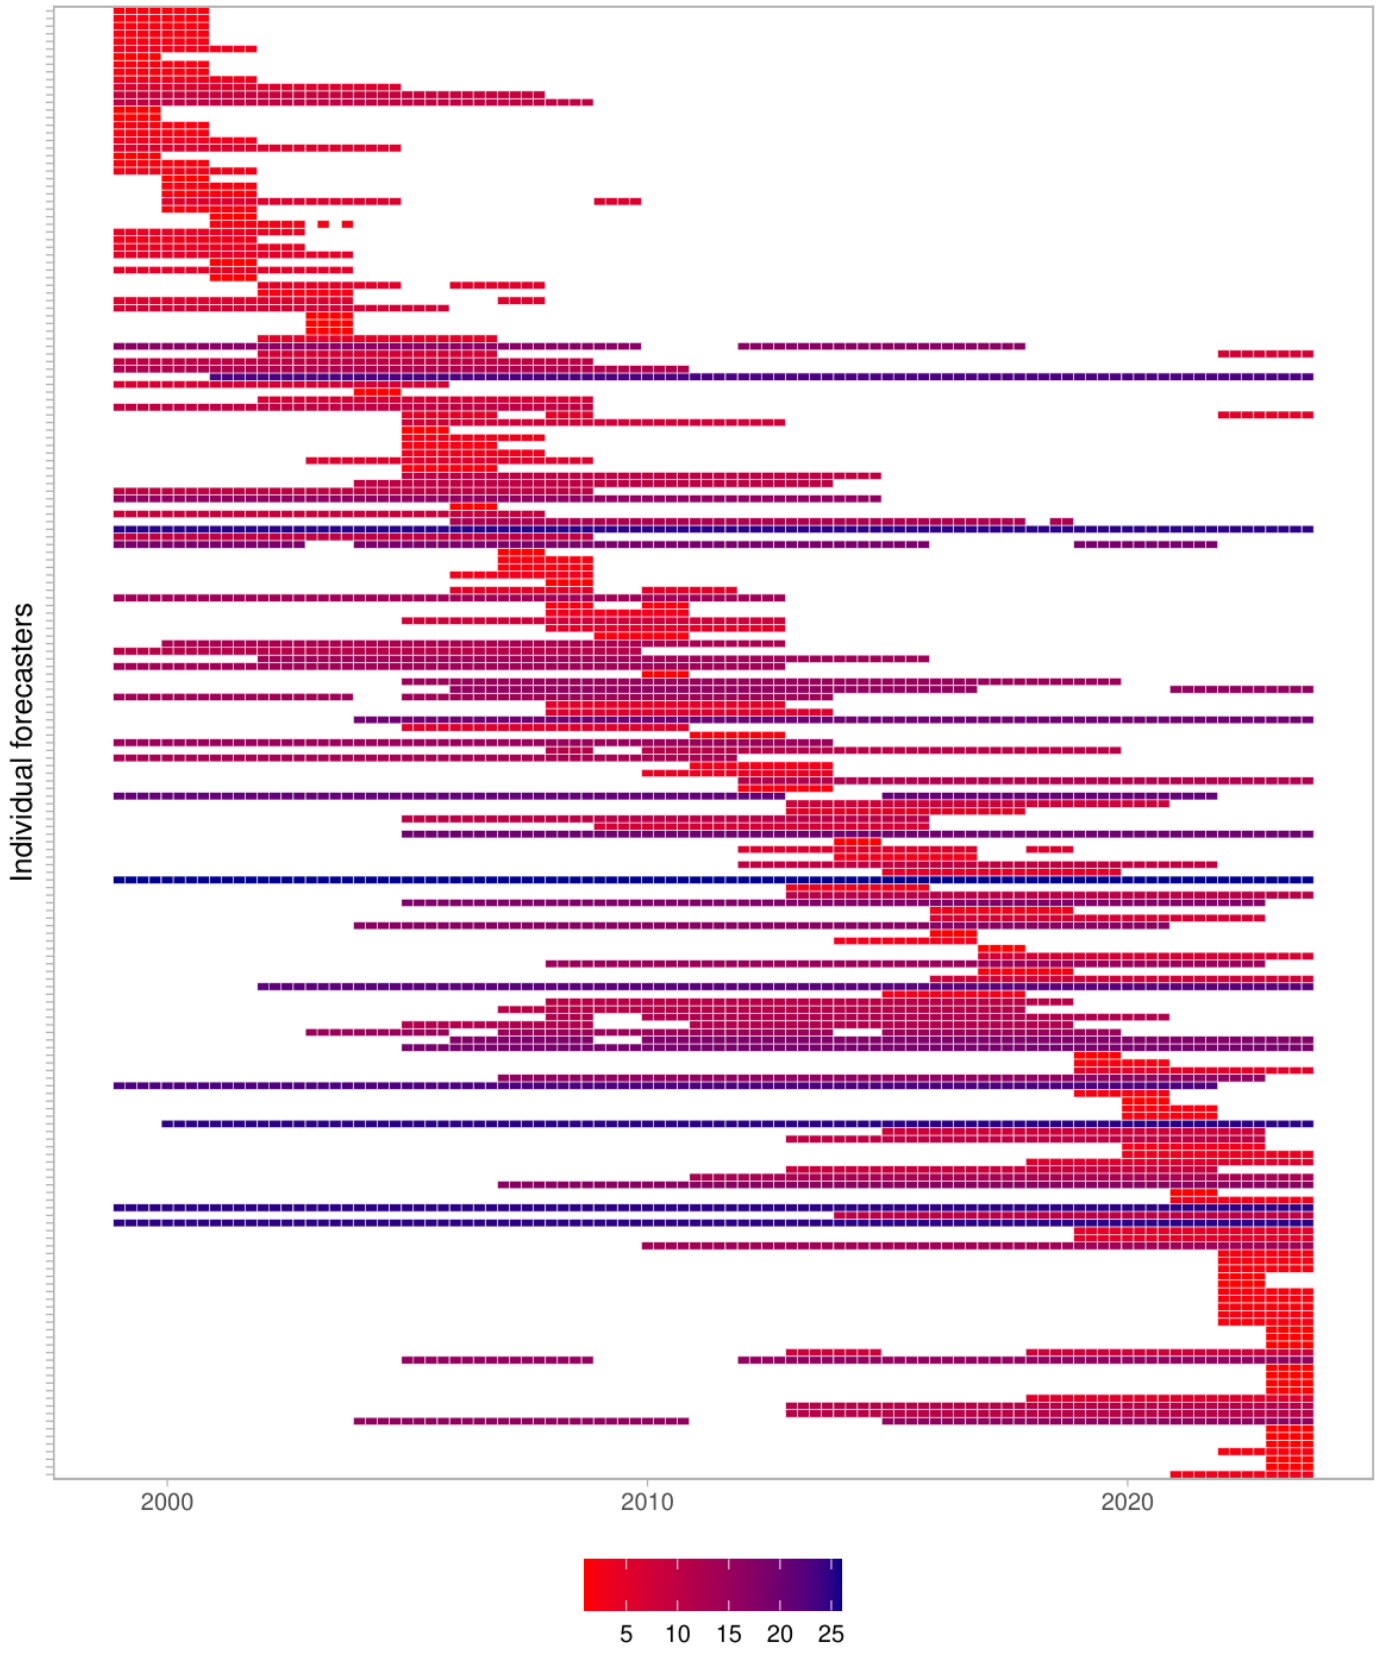

AI counts require the older baseline workbook, not the current baseline used by most tables.

Original | Figure A.2

Screenshot from original PDF page 62 · Duration of participation of each forecaster individual forecaster in the SPF panel over time

Figure A.2: Duration of participation of each forecaster individual forecaster in the SPF panel over time

The figure tracks the duration of individual forecasters' participation in the SPF panel, ranging from a few years to over 25 years. It shows a mix of long-term participants and those with much shorter tenures.

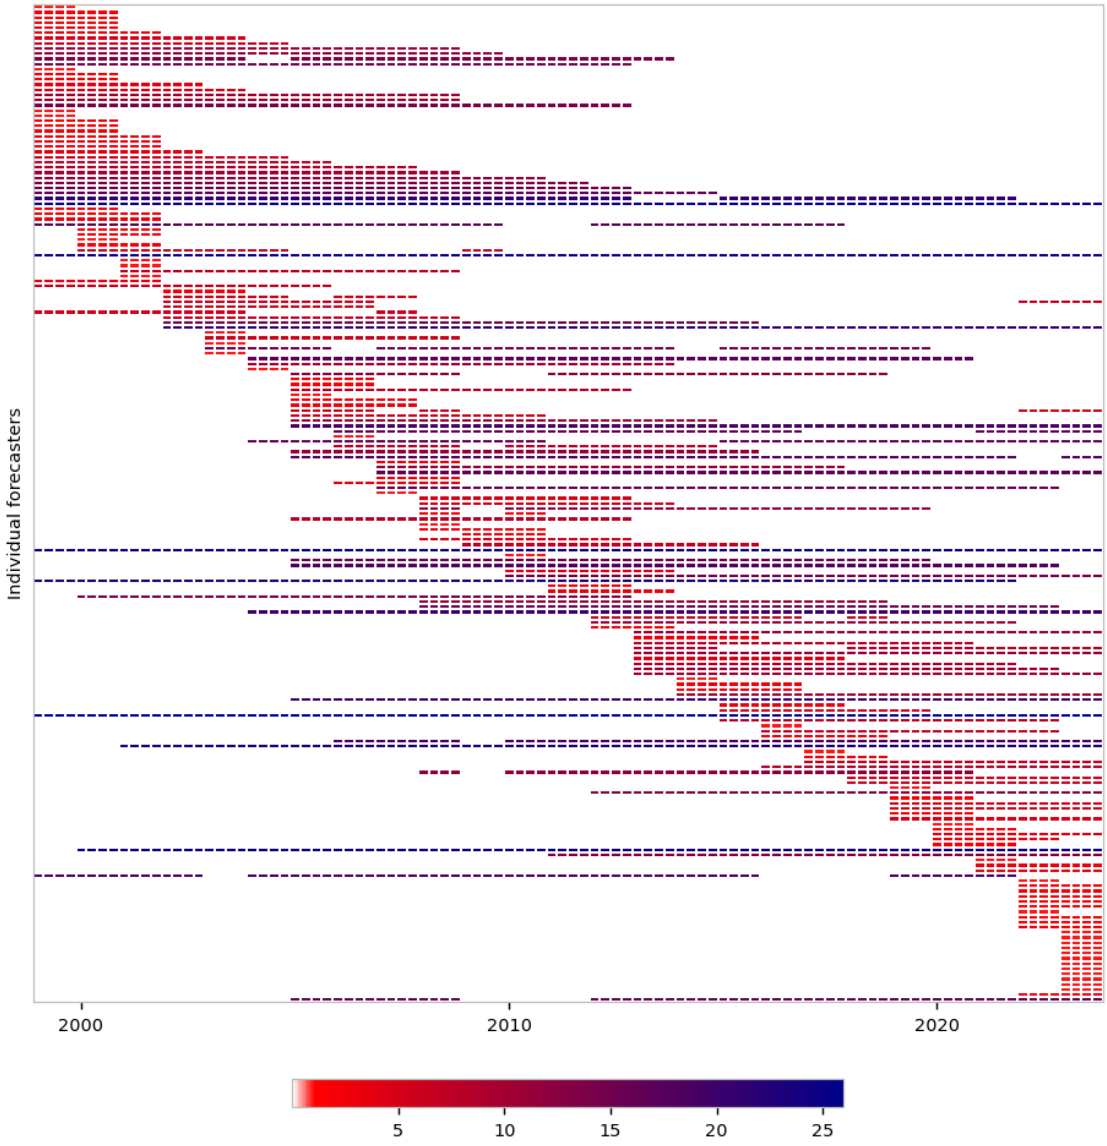

Reproduced | Figure A.2

Partial reproduction

Figure A.2. Duration of individual forecaster participation

Quarterly panel membership, ordered by starting date and participation duration. Color denotes total observed participation in years.

Port of fig_participation_over_time.R using available participation metadata for the original 193 names. The original has 5,232 tile records; current metadata have 5,236. Some quarterly memberships differ, so this is a partial replication.

Current metadata contain 5,236 records versus 5,232 in the original plotted asset.

Original | Table B.13

Screenshot from original PDF page 64 · Out-of-sample forecast accuracy (mean absolute errors) of SPF and AI-generated SPF forecasts

Table B.13: Out-of-sample forecast accuracy (mean absolute errors) of SPF and AI-generated SPF forecasts

The table shows forecast accuracy for the out-of-sample period, 2024 Q1 - 2024 Q4. Forecast accuracy is reported as mean absolute errors (MAEs) of SPF and AI-generated SPF forecasts for various economic indicators across different forecast horizons. For each forecasting horizon, the table boldfaces the lowest MAE value between the AI and human surveys. The P-val column reports p-values and significance levels for randomized tests of the statistical significance of the difference between AI and human MAEs. The tests are based on 10,000 random draws. Significance levels: * p-value≤0.10, ** p-value≤0.05, *** p-value≤0.01.

Saved OOS errors use 2023Q1–2024Q4 and horizons 0/1/4; printed labels say 2024 and 0/1/2. Saved h4 errors are unclipped where current prepare_data.R would clip, so raw preprocessing is not fully reproduced. A 2024-only diagnostic is saved.

Uses 2023-2024 and h0/1/4, unlike printed labels. Saved h4 errors are unclipped where current preparation code clips; raw preprocessing is not fully reproduced.

Original | Table B.14

Screenshot from original PDF page 65 · Out-of-sample forecast accuracy (mean absolute errors) of best human and AI SPF forecasters

Table B.14: Out-of-sample forecast accuracy (mean absolute errors) of best human and AI SPF forecasters

The table shows forecast accuracy for the out-of-sample period, 2024 Q1 - 2024 Q4. Forecast accuracy is reported as mean absolute errors (MAEs) of the best SPF and AI-generated SPF forecasts for various economic indicators across different forecast horizons. The best forecast is the forecast with lowest absolute error for each variable, horizon, and quarter For each forecasting horizon, the table boldfaces the lowest MAE value between the AI and human surveys. The P-val column reports p-values and significance levels for randomized tests of the statistical significance of the difference between AI and human MAEs. The tests are based on 10,000 random draws. Significance levels: * p-value≤0.10, ** p-value≤0.05, *** p-value≤0.01.

Historical reconstruction: older 492-row AI workbook, best AI per quarter versus HUMAN MEDIAN, evaluation targets through 2024Q4 (4/3/2 quarters). This differs from the caption’s best-human rule. The current-data/caption-method diagnostic is also saved; remaining mismatches are retained.

Older AI data and 2024 target cutoff improve agreement; best AI is compared with human median. Current-data caption method also saved.

Screenshot from original PDF page 68 · Forecast accuracy (mean absolute errors) of AI-generated and AR(1) SPF forecasts relative to human accuracy

Table D.15: Forecast accuracy (mean absolute errors) of AI-generated and AR(1) SPF forecasts relative to human accuracy

The table shows forecast accuracy reported as mean absolute errors of AI-generated SPF forecasts and forecasts implied by an AR(1) model of human SPF forecasts relative to the mean absolute errors of human SPF forecasts. Accuracy is reported for different forecast horizons, with 0, 1 and 4 denoting nowcast, one quarter and four quarters ahead, respectively. For each forecasting horizon, the table boldfaces the lowest MAE relative value between the AI and AR(1) model. The P-val column reports p-values and significance levels for Diebold and Mariano 1999 tests of the statistical significance of the difference between AI and AR(1) forecasts. Significance levels: * p-value≤0.10, ** p-value≤0.05, *** p-value≤0.01

Reconstructed with expanding OLS AR(1) models fitted separately to median human forecasts at each horizon, using only past survey observations from the baseline. Minimum training sample: two lagged pairs; rank-deficient fits are omitted. Ratios use the human MAE over its available sample; AI is restricted to dates with a human forecast, while AR(1) has fewer initial observations. Diebold-Mariano tests use absolute losses (power=1), Harvey small-sample adjustment, two-sided t reference, and test horizon h=1 for all three forecast horizons. All 138 ratios and 69 p-values match to two decimals; significance stars are separately checked.

Reconstructed AR(1) begins with two lagged pairs; DM test uses absolute loss and test horizon 1 for every forecast horizon.

Additional check

T7 | Consistent horizons for both panels

Table 7 diagnostic. Both panels at horizons 1 and 4

Variable	Short SD	Long SD	Ratio	t-stat	N
Panel: Human

Panel: AI					
CPI	0.266	0.253	0.95	-0.64	94
UNEMP	0.075	0.115	1.53	4.88***	72
RGDP	122.3	171.0	1.40	9.14***	91
TBILL	0.069	0.116	1.68	6.28***	73

This diagnostic corrects only the cross-panel horizon mismatch; it is not the printed table. All other inputs, positive-SD filtering, and paired tests are unchanged.

Diagnostic using one- and four-quarter-ahead forecasts for both human and AI panels; this is a correction of the horizon discrepancy, not a reproduction of the published table.
